

ABSTRACT (FIG.

To seal a spring chamber in a torsional vibration damper with two modules that rotate against each other, it is suggested that the first module has a first guide surface that seals the spring chamber radially to the outside, that is at a distance from the second module across a gap, and that has an axial surface component facing the spring chamber; and a second guide surface is provided that has an axial surface component which faces the spring chamber and covers the gap on the spring chamber side.
